

MODULAR HOME | 188 m²

Efficiency | Speed | Precision

GENERAL CONCEPT

SIZE: 188.29 m² (single storey)

BUILDING TYPE: Modular House

LAYOUT: 4 bedrooms

CONCEPT: New-build modular

FOUNDATION SYSTEM

The house is built on a thermally insulated concrete foundation slab, providing a stable and energy-efficient base.

Integrated insulation reduces heat loss and eliminates cold bridges, while water-based underfloor heating is built into the slab for even, comfortable heat distribution and long-term reliability.

HOUSE KIT / SIP CONSTRUCTION

The house is delivered as a fully engineered SIP-based kit, manufactured in a controlled factory environment for precision and consistent quality.

High-performance SIP walls achieve a U-value of up to $0.17 \text{ W/m}^2\text{K}$, ensuring excellent thermal efficiency, fast installation and a predictable construction process.

PROCESS

MEP SYSTEMS

The house includes integrated mechanical, electrical and plumbing systems, covering water supply, drainage, electrical installations and ventilation. All systems are coordinated to ensure efficiency, reliability and everyday comfort.

EXTERNAL FINISHES & WINDOWS

The exterior combines a standing-seam metal roof with durable wall finishes, including brick and ceramic cladding. High-performance PVC windows improve thermal efficiency, comfort and overall building performance.

INTERNAL FINISHES

The interior was designed in collaboration with a professional designer and the client. Carefully selected materials, finishes and lighting create a cohesive, comfortable living environment tailored to the owners.
